**TITLE: COMBINED CODE READER AND DIGITAL CAMERA**

**ABSTRACT OF THE DISCLOSURE**

An image capture system having an image capture module and a terminal unit captures both photo images and coded images. An alterable optical path of the system operates in a first configuration when capturing coded images and in a second configuration when capturing photo images. Captured images are presented on a display as they are captured. A user of the system may parse through captured images to select one or more of the captured images for permanent storage and/or transmission to a remote location. The system operates to identify coded targets within captured images, to prompt the user to select one or more of the identified coded targets and to decode the selected coded targets. The image capture system may direct a user to reposition the system so that a decodable coded image will be captured. The image capture system communicates over wireless and wired networks with remote computer systems, personnel, and mobile units.
